

Tungsten|solid: Cinemantiq Setup

[DOWNLOAD HERE](#)

CinemantiQ allows you to add several ingredients to your videos (or still images) that will make them look like the movies. It will convert your interlaced images to progressive frames via a smart deinterlacer taking the motion closer to that of projected 24 frames per second. It will also allow you to adjust the color characteristics of the image so that it more closely resembles film. Add diffusion and bloom, gradient lenses, mood setting colors, etc., either manually or through its single-click preset library. If that was not enough, CinemantiQ will process your video up to 40 times faster than other solutions! You won't know how good your video could look until you try CinemantiQ!
