Install Scripts Videos Install Your Own CGI & PHP Scripts On To Your Server Without Having To Hire A Programmer Full Master Resale Rights Included! Installing scripts on your own server can be an extremely challenging task for most people. Many choose to hire someone else instead to do the job for them. However, if you're just starting out with a low budget, it could be a pain for you to keep on outsourcing other people because the total cost will be quite high. Therefore, the solution is to learn yourself on how to do it. Once you're able to install your own scripts, it will be very easy for you to do the same task anytime in the future. The videos will walk you through step-by-step on how I install my PHP and CGI scripts on my own server. I'm confident that you'll be able to do the same once you've watched them and try them out on your own. The overall process of script installation is almost quite similar except that in a few cases, there are special needs for the specific script to be installed. Therefore, I have chosen a few scripts where the installation process differs slightly from one another.
