

# K-software Installer

[DOWNLOAD HERE](#)

A Java base software installer that organises your favourite downloads or favourite executable setup programs, displays Version, Product, Company & Version information about the files it found - It uses JNI to find the version information about each of the Windows files. Requires a JRE (Java Runtime Environment) to run, preferably 1.4.2\_0x or 1.5.0\_0x Designed to be placed on a CD with your favourite programs/setup applications or others of the like. o Create an Autorun.inf and copy JVersion.dll, JVersion.exe, version.jar and your preferred JRE to the ROOT of the CDROM and then copy (including directory structures), all of your installable software to the CDROM Place the CDROM into the CDROM drive of your computer. o The Autorun.inf - Should look similar to this: ----- [autorun] open=JVersion.exe icon=JVersion.exe ----- \* Exclude the hyphen's. It will traverse the directory structures in the root directory and find all files that have version information and display them in a Table. After which you can double click the (Version column) entry to install the application. If you want to have this software on your local machine and wish to search another directory or drive, simply, make a shortcut of JVersion.exe and pass the following arguments like so: [ JVersion.exe -filepath x:mydownloads ] where x:mydownloads is your favourite drive:[path].
