

P2p File Sharing Service Script

[DOWNLOAD HERE](#)

Our PHP P2P File Sharing script is the perfect solution for sharing files on all of the popular networks like, kazaa, eDonkey, Aries, bittorent, etc. How it works is users submit the files links they wish to share to your directory. When someone clicks on a file listed their file sharing client will automatically open and start to download the file that was listed. so, if a user is sharing the file through kazaa, kazaa would launch automatically and start downloading the file, if the file is an eDonkey file, eDonkey would open automatically and download the file for the user, etc. This script is written in PHP and requires 1 Mysql database. The admin panel is full of options to allow for you to control every aspect of the site. The included template directory can be used to change the look and feel of the site by simply using your favorite html editor like frontpage. This script was NOT written to aid in the sharing of copyright works! This script was written to allow a listing service or frontend to the popular filesharing networks. It will accept unlimited files from any file sharing network. Searches:php p2p script
