

Easy Download Page Protector Script - Mini Site Script

[DOWNLOAD HERE](#)

*** Start Making Money With Killer Mini Site *** - Easy To Use - No Database Required - You can sell digital product on autopilot! - You can sell MRR/PLR Products Securely - Customer can only access the Products after completing Payment! - You can replicate as many as you wish! - Payment directly and instantly sent to your Paypal Account! - Start Making Money While You Sleep! Protect your download area and links with Easy Download Page Protector Script. This is simple PHP Script that allows you to quickly secure your Download or Thank-you page without the need for your site to communicate with your Payment Processors site, (ie: PayPal's IPN system or ClickBank's Secure Key variable). All you need in order to utilize The Easy Download Page Protector is the simple ability to pass a Thank-you URL through your Payment processor. Something all the popular Payment Processors allow for. Your Download page will only be accessible to your purchaser for the amount of time you determine, it can be just until they download the product and close their browser window, (known as a Session Expiry), or they can have access to your Download/Thank-you page for any number of days you that predetermine. Not only that, your buyer will never see the URL to your actual Download/Thank-you Page. It keeps your URL hidden, but shows your Download/Thank-you page in a secure Web Page instead. You'll note that when you view the above page, you receive a Web Page Expired notice. This is exactly what your visitors, or any devious person using a search engine will see if they try and view your Download/Thank-you page without payment. Your Download/Thank-you Page will forever be secure, even if a purchaser of your's passes the URL on to a friend...Unless that other person purchases from your web site, they'll only receive the Expired Web Page notice! Secure your Thank-you page Today for only \$10. *** Risk Free Purchase! You get a 100, 8 Week, Money Back Guarantee! *** Requirement: PHP
