Microsoft VISTA Performance Tips Video Series Resell Rights Included! Make your computer run like a fine tuned sports car by doing a few simple task and running some free programs. There is no need to suffer because of slow system performance. Step by step videos will show you how to get your system running at optimum speed in no time flat! Is there anything more aggravating than working on a slow computer? If you are anything like me you spend a lot of time on your computer so it is important that it runs at a half decent speed when you are trying to get something done. Windows Vista is a very robust operating system It is visually appealing and is actually very well, optimized in each module. The only problem is that it uses a LOT OF MEMORY right out of the box. It does this because it tries to be all things to all people - so it loads up absolutely every bit of functionality it has every time you start up your computer. While this is not a huge problem with a powerhouse of a computer with tons of memory - it is a problem for a system with a minimum configuration for the operating system. As time goes on there tends to be some natural system degradation just from using the computer. If you do not perform several operations on a regular basis the computer will become slower and slower over time. This will eventually cause the most powerful of computers to bog down - so it is very important that these tasks get run on a regular basis. Windows Vista is a very complex operating system so you need to be careful when turning off the functionality that is bloating the memory usage and slowing down your computer. If you turn off one wrong item you could render Windows unusable - so you must be sure that you have proper instruction before you attempt to do this important step. There is also a cheap and easy way that you can emulate a fast memory upgrade using a simple and inexpensive USB device. This alone can make a huge difference to your system's speed. Here is What You Will Learn In These Videos: \* Speed up your system using simple maintenance techniques. \* Use free software to maintain your computer. \* Turn off unneeded Windows operating system items. \* Turn off unneeded Windows subprograms. and much more... It's time for you to get your computer running like you want it to run - FAST! Grab your copy now!
